

Compare and Contrast of RubberDecky and SandRich Systems

Both of our decorative resurfacing systems are non-cementitious, flexible and can be installed over our PerfectPrimer waterproof membrane system where desired. Both systems will adhere to virtually any building material or substrate. Both can be applied directly onto existing coatings and systems.

RubberDecky provides a simple, clean, look at a very competitive price. It is the worlds' easiest to apply overlay. It roller applies like paint and looks like concrete.

RubberDecky is ideal for light pedestrian or residential use, including tables and chairs. For applications that require heavy foot traffic, vehicles or commercial applications, use our SandRich system.

SandRich is flexible and waterproof, yet harder than concrete, epoxy, or steel. This coating is non-slip, attractive, and can be re-sealed to look new indefinitely.

To make RubberDecky or SandRich: begin by applying PerfectPrimer or PerfectPrimer membrane system to your substrate. Then;

To make RubberDecky; Apply additional PerfectPrimer with tint and our TrueGrit texture. Finish with our TopSealer as per instructions.

To make SandRich. Apply our adhesive, and one saturation coat of our aggregate. Then finish with our TopSealer as per instructions.

Summary: The PerfectPrimer, fabric, and TopSealer are the same for both systems. The difference is in the middle layers.

This difference affects the look, cost, labor and strength of the system to various degrees.

Both complete systems can be maintained indefinitely with periodic washing and re-sealing. Both are backed by our ten-year, renewable waterproofing guarantee.

Note: PerfectPrimer membrane is an extremely effective, stand-alone waterproofing or roofing membrane that you can for any project. You can also use it beneath any resinous coating as a crack isolation and waterproof layer for your overlay systems.
